Paterson, NJ

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## Objectives

- Discuss our current opioid epidemic
- Learn about alternatives through cases

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

# Alternatives to Opioids

---

---

---

---

---

---

---

---

---

---

---

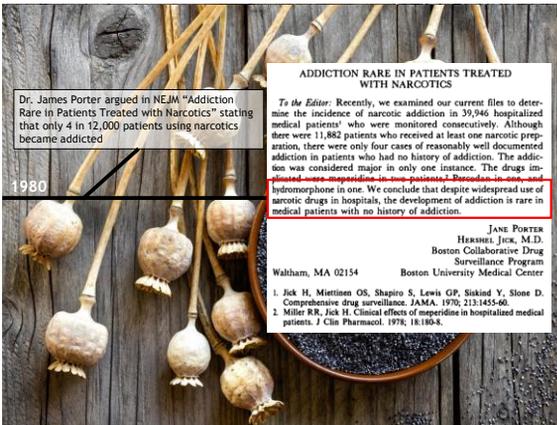

---

---

---

---

---

**#1 prescribed medication nationally from 2007-2013?**

- Vicodin

**How many adolescents between 12-17 years old are addicted to prescription opioids?**

- 168,000

**Where are they getting it from?**

- Medicine cabinets of family members and friends

---

---

---

---

---

---

---

---

## Numbers...

1.9 million  
dependent on opioid pain relievers

75%  
heroin users reported that their first opioid was a  
prescription drug

51  
people die per day from prescription opioid OD

18,893  
deaths per year

---

---

---

---

---

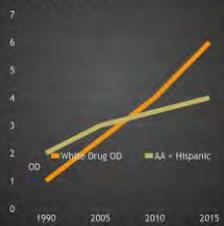

---

---

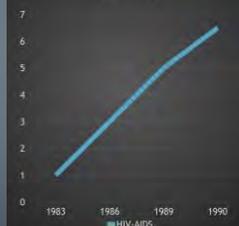

---

"Opioid overdose deaths in the US  
resemble a new infectious disease"

Death Rate  
Prescription Opioid OD  
1990-2015

Death Rate  
HIV-AIDS  
1983-1990

---

---

---

---

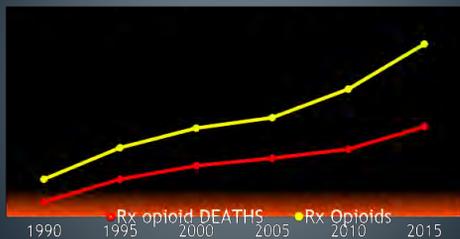

---

---

---

---

## Opioid Prescribing Habits vs. Prescription Opioid OD Deaths

---

---

---

---

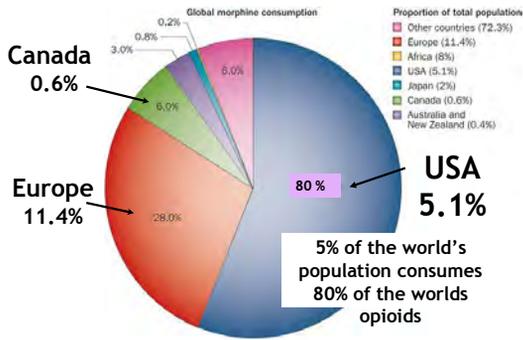

---

---

---

---

# Alternatives to Opioids

---

---

---

---

---

---

---

---

## Fentanyl Carfentanil

- Fentanyl is 100 x more potent than morphine and 50 x more potent than heroin.
- Cheaper to make and easier to transport
- Carfentanil 100 x more potent than Fentanyl

---

---

---

---

---

---

---

---

### What can we do in the Out-patient setting?

- **Keep opiate-naïve patients naïve**, prevent introducing opioid medications especially for chronic pain conditions.
- Use alternative therapies to patients who are already opioid tolerant who present to the ED in acute pain
- Educate our patients on managing their expectations of pain and the dangers of addiction

---

---

---

---

---

---

---

---

Opioids are necessary.....

.....but they are not the solution for all pain

- **THINK** before you prescribe
- **USE** alternatives whenever possible
- **CARE** about the patient

---

---

---

---

---

---

---

---

ALTO<sup>SM</sup>

Alternatives to Opioids

- Renal Colic
- Musculoskeletal Pain
- Lumbar Radiculopathy
- Migraine Headache
- Extremity Fracture/Dislocation

---

---

---

---

---

---

---

---

## Case 1

- MM is a 57 year old female who presents to the ED with severe flank pain and vomiting. History of kidney stones in the past.
  - PMHx: none, PSHx: none, NKDA, No med prior to arrival
- Toradol 30 mg IV
- 1 L NS
- Zofran 4 mg IV

---

---

---

---

---

---

---

---

## Case 1, continued

• MM reports minimal pain relief and is still in distress. Next line therapy?

### • Morphine?

- Patient received morphine 5 mg IV.
  - VERY minimal pain relief
- She receives another morphine 5 mg IV + Zofran
  - Pain is unchanged and she is vomiting

---

---

---

---

---

---

---

---

## Failure of Treatment

- Toradol 30 mg IV
- Zofran 4 mg IV x 2
- NS 1 L bolus
- Morphine 10 mg IV
- Now what?

---

---

---

---

---

---

---

---

## Case 2

• JA 28 year old male presents with severe kidney stone pain. He has a history of kidney stone pain in the past and is in recovery for heroin addiction, 7 months clean.

• Last time he had a kidney stone, he received morphine, he states it took him weeks to overcome the craving for heroin

---

---

---

---

---

---

---

---

## Alternatives?

- Is there evidence to support the use of alternatives for renal colic?

---

---

---

---

---

---

---

---

## Intravenous Lidocaine

- Intractable oncological pain
  - Improved pain with fewer side effects, compared to opiates alone
  - Little to no toxicity
  - Improved quality of life
- Post-operative pain relief, meta-analysis
  - Reduced pain at rest, with movement, and with cough
  - No statistical difference in adverse events

Ferrini 2004  
Vigneault 2011

---

---

---

---

---

---

---

---

## Lidocaine for Post- Op Pain Cochrane Review

- Immediately reduced pain lasting up to 24 hours
- Less opiates
- Decreased LOS
- Quicker bowel function return
- Less nausea
- No difference in rate of death, arrhythmia, toxicity, or other heart disorder
- *Low to moderate evidence that intravenous lidocaine has an impact on pain scores compared to placebo*
- *More studies need to be done*

Kranke 2015

---

---

---

---

---

---

---

---

## Mechanism of action

- Inhibits afferent sensory conduction
  - Analgesia
- Paralyzes the ureter
  - Quicker stone passage?

---

---

---

---

---

---

---

---

## Intravenous Lidocaine

- Cardiac Monitor
- 1.5 mg/kg (200 mg/100 mL NS) over 10 minutes on a pump
  - MAX 200 mg

---

---

---

---

---

---

---

---

## Take Home Point #1

- Intravenous lidocaine is a safe and effective analgesic for renal colic.

---

---

---

---

---

---

---

---

## Case 3

- 57 M presents with 2 days of acute low back pain after moving a sofa. Has tried ibuprofen once per day without much relief.
  - PMHx- high cholesterol
  - NKDA
- What's the best treatment for him?

---

---

---

---

---

---

---

---

## Opioids are not first line!

- Early opioids prescribing
  - Increase rate of MRI
  - Significantly higher medical costs
  - 29% more likely to end up on chronic opioids

### Multimodal approach

- NSAIDs
- Tylenol
- Topical medications (Lidoderm, Flector patches)
- Trigger point injections
- Gabapentin
- +/- muscle relaxants

---

---

---

---

---

---

---

---

## NSAIDs and Tylenol

- NSAIDs work better with Tylenol
  - Tylenol 1000 mg
- Analgesic ceiling
  - ~400 mg/dose or ~1200 mg/day

Friedman 2015  
Derry 2013  
McQuay 2007  
Seymour 1996

---

---

---

---

---

---

---

---

## Topicals

- Lidoderm patches
- Diclofenac gel improves pain associated with OA of the knee and musculoskeletal injuries
  - NNT 1.8

Galer 2004  
Wadsworth 2016  
Baril 2011  
Barthel 2010  
Cochrane 2015

---

---

---

---

---

---

---

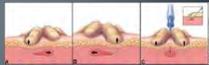

---

## Trigger Point Injections

Area of spasm that reproduces pain, typically from an injury or pain >24 hours old. Usually in the back

- 0.5% marcaine without epi- 1-2 mL
  - +/- steroids
  - 25 gauge needle
  - Alcohol swab
  - Band-aid
  - Consent
- Infection, bleeding

Contraindications: cellulitis over area, anticoagulation, allergy to local anesthetic

---

---

---

---

---

---

---

---

## Trigger Point Injection Technique

- [https://www.youtube.com/watch?v=M6A8a\\_7Uv10](https://www.youtube.com/watch?v=M6A8a_7Uv10)
- (end at min 3:30)

---

---

---

---

---

---

---

---

## Take Home Point # 2

- Most acute low back pain does not require opioids
- NSAIDs + Tylenol + Topicals
  - Muscle relaxant may be necessary

---

---

---

---

---

---

---

---

## Case 4

- 57 M with chronic pain due to lumbar radiculopathy presents with an acute flare. He takes MS Contin 100 mg PO BID and oxycodone 30 prn.
- No focal neuro deficits but in severe distress.
- Management?

---

---

---

---

---

---

---

---

## Your Brain on Opioids

- The neurochemistry of the brain changes when exposed to chronic opioids
- More opioids does not equal better relief
- Allodynia
- Hyperalgesia
- Chronic Pain

---

---

---

---

---

---

---

---

## Opioid Tolerant Patients

- NSAID + Tylenol
- Gabapentin 300 mg
- Valium or Flexeril
- Ketamine infusion + drip

---

---

---

---

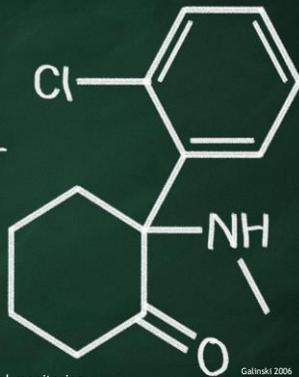

---

---

---

---

Ketamine  
 $C_{13}H_{16}ClNO$

- Antagonizes NMDA receptor
  - Sole agent for analgesia
- Sub-dissociative dosing
  - 0.3 mg/kg infusion
  - 0.1 mg/kg/hour drip
- Opioid sparing effect
- No vital sign changes, no additional monitoring

Galinski 2006  
Makov 2015  
Miller 2015

---

---

---

---

---

---

---

---

## Ketamine

- Mild transient dysphoria
- “Prepare the patient”
- Emergence, rare if at all
  - Benzos
- Once patient is better, stop drip and discharge

---

---

---

---

---

---

---

---

## Ketamine

- Intranasal
  - Safe in children
  - 0.5 mg/kg MAX 50 mg/dose
    - MAX volume 1 mL/nare
  - No change in vital signs
  - Significant reduction in pain score
  - Easy to administer
  - Can re-dose
  - Works within 15 minutes

Andalfatto 2013  
Yeaman 2013  
Yeaman 2014  
Shrestha 2016

---

---

---

---

---

---

---

---

## Take Home Message #3

- Ketamine can be used in conjunction with opioids or as a sole agent for analgesia in the emergency department for acute and chronic pain.
- Intranasal administration is effective and easy.

---

---

---

---

---

---

---

---

## Case 5 (last case)

- 23 M comes to ED for gluteal abscess. The patient is in the urgent care/fast track section. The abscess is LARGE. He has had them before and is pleading with you to "put me to sleep"
- What can be done to adequately treat the patient's pain in a fast track setting?

---

---

---

---

---

---

---

---

## Nitrous Oxide

---

---

---

---

---

---

---

---

## Nitrous Oxide

- Tasteless colorless gas administered in combination with oxygen via mask or nasal hood
  - Maximum concentration 70% N<sub>2</sub>O
- Absorbed via pulmonary vasculature and does not combine with hemoglobin or other body tissues
- Rapid onset and elimination
  - <60 seconds

Becker 2008

---

---

---

---

---

---

---

---

## Benefits of Nitrous Oxide

- Analgesic and anxiolytic agent
  - Use along with local anesthetic or other pain medications
  - Releases enkephalins, effects reversed with naloxone
- Only monitoring is pulse oximetry
- No NPO requirements, patient can drive after administration, no IV line needed

Bahl 2015  
Zhang 1999  
Becker 2008  
Chapman 1993

---

---

---

---

---

---

---

---

## Nitrous Oxide Evidence

- It is indicated for any and every painful condition
- All ages

- Laceration
- Lumbar puncture
- Peripheral and central venous access
- I&D
- FB removal
- Burn/Wound Care
- Fecal Disimpaction

Herres 2015      Ducasse 2013  
Hamp 2012      Abuamrout 2011  
Euring 2009      Alashi 2005

---

---

---

---

---

---

---

---

## The Downside to Nitrous Oxide

- Abuse potential
- Mobile unit
- Patient should be awake enough to hold mask
- Patients may feel claustrophobic when using the face mask

---

---

---

---

---

---

---

---

## Contraindications

- COPD or severe active asthma
- Vitamin B12 deficiency
- Otitis Media, Sinusitis
- Bowel Obstruction
- Altered level of consciousness
  - Psychiatric disease, EtOH, Head Injury
- 1<sup>st</sup> and 2<sup>nd</sup> trimester pregnancy

---

---

---

---

---

---

---

---

## Take Home Point #4

- Nitrous Oxide is a fast acting easily administered analgesic, ideal for the management of acute pain

---

---

---

---

---

---

---

---

## Summary

- Renal colic → IV LIDOCAINE
- Low Back Pain → Tylenol, NSAIDs, topicals and Trigger Point Injection
- Opiate Tolerance → KETAMINE
- Procedures → NITROUS

---

---

---

---

---

---

---

---

- The stigma of addiction still exists...
- Most insurance companies do not cover inpatient detox programs for more than 28 days
- Most insurance companies do not cover topical medications (Lidoderm patches)
- Cost of IV morphine \$16 (30 mg), IV hydromorphone \$21 (6 mg) while the cost of Ofirmev (IV acetaminophen) \$35 per 1 gm vial.
- Collaborative effort required from hospital administrators, pharmacy nursing staff and fellow doctors

---

---

---

---

---

---

---

---

## Keep opioid exposure to a minimum

- The use of alternatives for pain management decreases unnecessary exposure of potential harmful medications to our patients.
- Opioids are important but should not be reflexively prescribed

---

---

---

---

---

---

---

---

## Summary

- Promote prescribing alternatives whenever possible
- Prevention is KEY!
- Support patients who suffer from the disease of addiction
- Educate our patients on the potential dangers of medications prescribed

---

---

---

---

---

---

---

---

## Thank you!

---

---

---

---

---

---

---

---
